Chronic Mesenteric Ischemia

• Decreased perfusion to visceral organs, especially intestine
Clinical Presentations

• Typical presentations
  • Postprandial abdominal pain
    • Epigastric or periumbilical
  • Fear of eating
  • Weight loss
Diagnosis

- **US Criteria >70% stenosis**
  - Fasting
  - SMA: PSV > 275 cm/s
    EDV > 45 cm/s
  - Celiac: PSV > 200 cm/s
    EDV > 55 cm/s
Diagnosis

- CTA

  - Choice of imaging study
  - Direct evidence of visceral artery disease
  - Evidence of bowel infarction
  - Associated pathology
Diagnosis

• Interventional Angiography
  • Diagnostic
  • Therapeutic
    • Endovascular treatment

• Less Invasive
  • When compared to open surgery
Diagnosis

  • When compared to open surgery
Endovascular Treatment

PTA of SMA first reported in 1980
Open versus endovascular revascularization for chronic mesenteric ischemia: Risk-stratified outcomes

Gustavo S. Oderich, MD, Thomas C. Bower, MD, Timothy M. Sullivan, MD, Haraldur Bjarnason, MD, Stephen Chu, MS, and Peter Głowiczki, MD, Rochester and Minneapolis, Minn.

**Primary Patency**
- OR 88 ± 3%
- ER 41 ± 9%

**Secondary Patency**
- OR 97 ± 2%
- ER 88 ± 4%

NS). In the subset analysis of patients having first-time operations vs stenting, OR resulted in improved ($P < .05$) recurrence-free survival (91% ± 3% vs 56% ± 8% at 5 years) and better primary and secondary patency rates (93% ± 2% and 98% ± 1% vs 52% ± 8% and 93% ± 4% at 3 years).

**Conclusion:** OR has similar mortality but higher morbidity and longer hospitalization than ER in low-risk or high-risk patients with CMI. Both treatments effectively improved symptoms, but restenosis, recurrent symptoms, and reinterventions were more likely in ER patients. These findings may guide treatment selection and counseling of low-risk and high-risk CMI patients undergoing OR or ER procedures. (J Vasc Surg 2009;49:1472-9.)
Table I. Baseline characteristics of patients undergoing angioplasty, with or without stenting, compared with surgical repair for chronic and acute mesenteric ischemia from 2000 to 2006

AFib, Atrial fibrillation; CAD, coronary artery disease; CHF, congestive heart failure; COPD, chronic obstructive pulmonary disease; CVD, cerebrovascular disease; MI, myocardial infarction; PTSA/S, percutaneous transluminal angioplasty, with or without stenting; PVD, peripheral vascular disease; SD, standard deviation.

*Surgery includes bypass, endarterectomy, or embolectomy.

Statistical significance set at $P < .01$. 

Nationwide Inpatient Sample
Endovascular Treatment

- When to intervene
- How many vessels need to be treated
- Crossing the lesions
- PTA vs. Stenting
- Post-tenting medical management
Endovascular Treatment

- When to intervene
- How many vessels need to be treated
- Crossing the lesions
- PTA vs. Stenting
- Post-tenting medical management
Indications

- High grade stenosis or total occlusion
- Symptomatic
- Asymptomatic
  - >2-vessel significant disease
    - Without revascularization, >30% will develop bowel infarct in 2-3 years
Endovascular Treatment

- When to intervene
- **How many vessels need to be treated**
- Crossing the lesions
- PTA vs. Stenting
- Post-tenting medical management
Endovascular Treatment

- Reportedly **1.4-1.8 vessels** were treated

- **Single-Vessel** revascularization
  - Adequate to relieve symptoms in most of patients

- **Two-vessel** revascularization
  - Lower risk of symptom recurrence and secondary re-intervention
Endovascular Treatment

- When to intervene
- How many vessels need to be treated
- **Crossing the lesions**
- PTA vs. Stenting
- Post-tenting medical management
Endovascular Treatment

- Lateral view
  - Roadmap if needed
- Angle sheath and catheter
- Brachial access if sharp angle
Endovascular Treatment

- Crossing catheter
- CTO devices
- Pre-dilatation: 3-4 mm balloon before stenting
- Embolization protection devices
  - May need if 3-vessel disease and SMA is the only vessel treatable
Endovascular Treatment

• When to intervene
• How many vessels need to be treated
• Crossing the lesions
• PTA vs. Stenting
• Post-tenting medical management
Endovascular Treatment

- Balloon angioplasty (PTA) alone
  - 15%

- Primary stenting
  - 85%
  - Lower recoil and re-intervention
  - Balloon expendable stent
    - Accurate
    - May post-dilate to a larger size if needed
  - Covered stent is recommended if instent stenosis
Endovascular Treatment

- When to intervene
- How many vessels need to be treated
- Crossing the lesions
- PTA vs. Stenting
- Post-stenting medical management
Endovascular Treatment

Post-procedure medications

- Plavix: 6 months
- ASA: life time
Open Surgery

- Surgery
  - Bypass
    - Antegrad vs. Retrograde
    - Single vs. Multiple
    - Vein vs. Prosthetic

- Re-implantation
Open Surgery
In Summary

• **Indications for endovascular treatment of CMI**
  • Symptomatic
  • Asymptomatic with 2 vessel significant disease

• **One vessel PTA/Stenting is adequate**
  • Two-vessel treatment has better long-term outcomes

• **Primary stenting is recommended**

• **Balloon expendable stent is preferred**

• **Post-stenting antiplatelet**
  • Plavix 6 months
  • ASA life time
In Summary

- Indications for endovascular treatment of CMI
  - Symptomatic
  - Asymptomatic with 2 vessel significant disease
- One vessel PTA/Stenting is adequate
  - Two-vessel treatment has better long-term outcomes
- Primary stenting is recommended
- Balloon expendable stent is preferred
- Post-stenting antiplatelet
  - Plavix 6 months
  - ASA life time
